

Machine Learning

Machine learning is a branch of artificial intelligence that enables computers to learn patterns from data. Supervised learning uses labeled examples for tasks such as classification and regression. Unsupervised learning works with unlabeled data and includes clustering. A training dataset is used to learn a model, while test data is used to measure how well the model generalizes to unseen examples. Common machine learning algorithms include linear regression, logistic regression, decision trees, random forests, support vector machines, and k-nearest neighbors.
